PROFESSIONAL SUMMARY

Information Technology undergraduate (Class of 2029) with hands-on experience building full-stack web applications in Python and Django. Completed an intensive full-stack development program covering authentication, payment integration, and relational database design, and independently built three end-to-end projects from data model to interface. Seeking a software engineering internship to apply strong CS fundamentals and self-directed project experience in a collaborative engineering environment.

TECHNICAL SKILLS

Languages: Python, Java, C, SQL, JavaScript

Backend: Django, REST API Design & Integration, Session-Based Authentication

Frontend: HTML5, CSS3, Bootstrap 4/5

Databases: PostgreSQL, MySQL, SQLite — Relational Schema Design, Query Optimization

Payments: Stripe API Integration

Tools: Git, GitHub (branching, pull requests), VS Code

Core CS Concepts: OOP, Data Structures & Algorithms, DBMS, Operating Systems, Computer Networks

PROJECTS

E-Commerce Web Application — Python, Django, PostgreSQL, Stripe API, Git

- Built a complete checkout experience by integrating Stripe's payment API with Django's order and session models, handling edge cases such as abandoned carts and duplicate submissions
- Implemented user authentication and cart persistence from scratch, designing the underlying data model before writing any views or templates
- Structured the application into modular Django apps to support incremental feature development without breaking existing functionality

Global Consent Ledger (GCL) — Python, Django, PostgreSQL, REST APIs, SHA-256

- Designed a tamper-evident audit logging system using SHA-256 hash chaining, so altering any single record would break the integrity of the entire chain
- Built policy-change detection logic to automatically flag version conflicts, reducing the need for manual compliance review
- Exposed consent data through REST API endpoints designed for third-party integration and transparent access

WeatherHub - Real-Time Weather Forecast App — Python, Django, Bootstrap 5, SQLite, OpenWeatherMap API

- Integrated the OpenWeatherMap REST API to deliver real-time 5-day forecasts, handling failure cases such as rate limits and invalid location input
- Added GPS-based geolocation alongside manual city search, giving users two reliable ways to retrieve local weather data
- Persisted user search history at the session level to reduce repeated lookups and improve the return-visit experience

EDUCATION

B.Tech, Information Technology — SRM TRP Engineering College | 2026 - 2029 (Expected) | CGPA: 8.0

Higher Secondary Education — St. James Matric Hr. Sec. School | State Board | 2025 | 80%

CERTIFICATIONS

- Python Full Stack Development – Pere Technologies (2026)
- AWS Cloud Practitioner Essentials
- Database Engineer – Meta (Coursera)
- Cyber Job Simulation – Deloitte Australia (Forage)
